Was Your Child Exposed to Alcohol During Pregnancy?

Have you been told your child is "too active"?

- Have you thought your child may have **Attention Deficit Hyperactivity Disorder (ADHD)?**
- Have friends, relatives, or your child's teacher suggested your child may have ADHD?
- Has your child been diagnosed with ADHD?

If the answer is "**YES"** to any of these questions **and your child is 8 to 12 years of age,** we would like your child to participate in a **UCLA research study** of a non-medication treatment for children with prenatal alcohol exposure and symptoms of inattention, impulsivity, and hyperactivity. Both in-person and remote (via Zoom) participation are possible.

Your child will receive…

- A cognitive and behavioral assessment
- An assessment for Fetal Alcohol Spectrum Disorders (FASD)
- 4 weeks of treatment with Trigeminal Nerve Stimulation (TNS) involving 2 small electrodes placed on the child's forehead and worn during sleep
- 2 MRI brain scans. MRI is safe and does not use radiation.
- A $100 gift certificate to Target

If interested, please find out more about the study by contacting us by phone, email, online, or QR Code!
